

M62392P,FP

8-BIT 12CH I²C BUS D-A CONVERTER WITH BUFFER AMPLIFIERS

GENERAL DESCRIPTION

The M62392P,FP is a CMOS 12-channel D-A converter with output buffer amplifiers.

It can communicate with a microcontroller via few wiring thanks to the adoption of the two-line I²C BUS.

The output buffer amplifier employs AB class output with sinking and sourcing capability of more than 1.0mA , and an output voltage range is nearly between ground and VrefU.

Maximum 8 ICs can be connected to a bus by using three chip-select pins, so that it is possible to handle up to 96 channels.

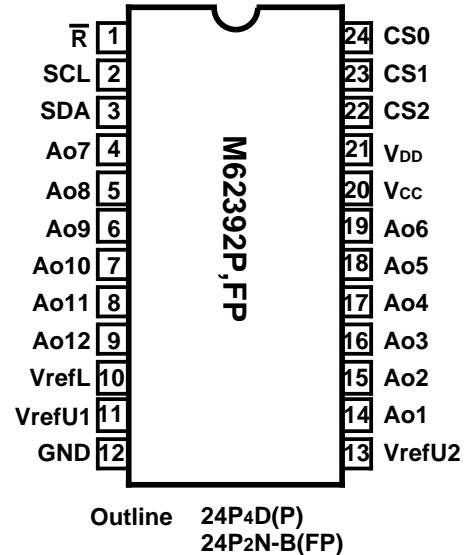

FEATURES

- I²C-bus serial data method
- Wide output voltage range
Nearly between ground and VrefU (0~5V)
- High output current drive capability
over $\pm 1.0\text{mA}$
- 2 setting voltage ranges by dual input pins for upper voltage references (VrefU1,U2)

APPLICATION

Conversion from digital data to analog control data for both consumer and industrial equipment.
Gain control and automatic adjustment of DISPLAY-MONITOR or CTV.

TIMING CHART (MODEL)

•Start condition With SCL at HIGH,SDA line goes from HIGH to LOW

•Stop condition With SCL at HIGH,SDA line goes from LOW to HIGH

(*Under normal circumstances,SDA is changed when SCL is LOW)

•Acknowledge bit The receiving IC has to pull down SDA line whenever receive slave data.
(The transmitting IC releases the SDA line just then transmit 8bit data.)

PRECAUTION FOR USE

M62392 have 5 terminals (VDD,VCC,VrefU1,VrefU2,VrefL) for input constant voltage at use.

IF ripple or spike is input these terminals,accuracy of D-A conversion is down. So,when use this device,please connect capacitor among each terminal to GND for stable D-A conversion.

This IC's output amplifier has an advantage to capacitive load.So it's no problem at device action when connect capacitor (0.1 μ F MAX) among output to GND for every noise eliminate.
